

“PANDORA'S BOX” IN THE BODY

Far too often, physicians will make mountains out of molehills by doing invasive biopsies or surgery to remove abnormal masses or cell growths within the body. The problem with this approach is that in many cases the otherwise harmless cancer cells will spread and grow to other areas of the body. This is similar to opening Pandora's Box. Pandora's Box is the mythological story of all treachery and evils that could trouble mankind upon opening the box.

There are millions of people who have harmless cancer cells that remain stagnant in certain areas of the body as long as they are left alone. For example, many women have uterine/ovarian cysts or cysts within the breast glands. If these harmless abnormal growths are left alone, most women will live longer and with a better quality of life than if she had undergone surgery, radiation, or chemotherapy drugs to try and eliminate the cancer cells.

We understand that harmless tumors and cancer cells may live in our bodies and will not bother us as long as they are left alone. This is especially true when you have the 6 criteria of health. Western medicine is different. Once they find these suspicious growths on xrays or under microscopes, they try to kill or remove the cells. This often does more harm than good as surgery can leave bruises for the growths to come back and multiply even further to reside in.

There have been many reported cases of patients making inquiry into a suspicious growth in their body. When your body symptoms are good, do not make mountains out of molehills by opening Pandora's box.
